Machine Learning and Human Intelligence Rosemary Luckin 2018-06-22 Intelligence is at the heart of what makes us human, but the methods we use for identifying, talking about and valuing human intelligence are impoverished. We invest artificial intelligence (AI) with qualities it does not have and, in so doing, risk losing the capacity for education to pass on the emotional, collaborative, sensory and self-effective aspects of human intelligence that define us. To address this, Rosemary Luckin-leading expert in the application of AI in education - proposes a framework for understanding the complexity of human intelligence. She identifies the comparative limitation of AI when analyzed using the same framework, and offers clear-sighted recommendations for how educators can draw on what AI does best to nurture and expand our human capabilities. **Artificial Intelligence and the Two Singularities** Calum Chace 2018-04-20 The science of AI was born a little over 60 years ago, but for most of that time its achievements were modest. In 2012 it experienced a big bang, when a branch of statistics called Machine Learning (and a sub-branch called Deep Learning) was applied to it. Now machines have surpassed humans in image recognition, and they are catching up with us at speech recognition and natural language processing. Every day, the media reports the launch of a new service, a new product, and a new demonstration powered by AI. When will it end? The surprising truth is, the AI revolution has only just begun. Artificial Intelligence and the Two Singularities argues that in the course of this century, the exponential growth in the capability of AI is likely to bring about two "singularities" - points at which conditions are so extreme that the normal rules break down. The first is the economic singularity, when machine skill reaches a level that renders many of us unemployable and requires an overhaul of our current economic and social systems. The second is the technological singularity, when machine intelligence reaches and then surpasses the cognitive abilities of an adult human, relegating us to the second smartest species on the planet. These singularities will present huge challenges, but this book argues that we can meet these challenges and overcome them. If we do, the rewards could be almost unimaginable. This book covers: • Recent developments in AI and its future potential • The economic singularity and the technological singularity in depth • The risks and opportunities presented by AI • What actions we should take Artificial intelligence can turn out to be the best thing ever to happen to humanity, making our future wonderful almost beyond imagination. But only if we address head-on the challenges that it will raise. Calum Chace is a best-selling author of fiction and non-fiction books and articles, focusing on the subject of artificial intelligence. He is a regular speaker on artificial intelligence and related technologies, and runs a blog on the subject at www.pandoras-brain. com. Prior to becoming a full-time writer and speaker, he spent 30 years in business as a marketer, a strategy consultant, and a CEO. He studied philosophy at Oxford University, where he discovered that the science fiction he had been reading since boyhood was simply philosophy in fancy dress.

New Technologies, Artificial Intelligence and Shipping Law in the 21st Century Professor Barış Soyser 2019-08-05 New Technologies, Artificial Intelligence and Shipping Law in the 21st Century consists of edited versions of the papers delivered at the Institute of International Shipping and Trade Law's 14th International Colloquium at Swansea Law School in September 2018. Written by a combination of top academics and highly experienced legal practitioners, these papers have been carefully co-ordinated to give the reader a first-class insight into the issues surrounding new technology and shipping. The book is set out in three parts: Part I offers a detailed and critical analysis of issues that are emerging, and those that are likely to emerge, from the use of advanced computer technology, particularly at the contracting process and in the context of issuing trading documents. Part 2 focusses on artificial intelligence and discusses the contemporary issues that will emerge once autonomous ships and similar crafts are put to use in the world's oceans. As well as this, the legal impact of ports utilising artificial intelligence and computer technology will also be considered. Part 3 analyses how the increasing use of legal technology is changing insurance underwriting and shipping litigation. An invaluable guide to the recent technological advances in shipping, this book is vital reading for both professional and academic readers.

Artificial Intelligence in China in Its Direct Sources Walter Farah Calderón 2017-06-22 There is no doubt that Artificial Intelligence (AI) is part of our time, even eager for its happy kingdom: the world of the data. Its importance is expressed in many ways. In the growth of research, public and private investment, the emergence of various niches associated with their potential applications and even their promotion as state policy.In the latter case, in recent years, several countries have announced and initiated strategic programs to support the AI, so far in 2017, particularly Canada and China. In both cases, AI is seen as a tool for developmentIn the case of Canada, the promotion of the AI was part of a heritage accumulated by research in that country since the end of the last century. In the case of China, without historical tradition in AI, it would be necessary to take a step back, since the promotion of AI is part of a greater effort: to transform innovation as the axis of development and the science and technology as one of its key factors.The present work continues the methodology already used in the case of the Pan-Canadian Artificial Intelligence Strategy, consisting of gathering, providing thematic cohesion and continuity in the edition, recapitulating the essential sources of the subject in question.Under this format, the use for researchers, specialists, and public policy makers is greatly expanded, since not only the information but also the original source is available if the transcribed material (APA methodology) is required to be collated.Our work has another advantage: it helps to overcome the difficulty associated with the information that appears before our eyes every day, as a news flash, as a daily surprise, without a common thread that unites it to rescue its meaning and orientation.With particular emphasis on the years 2016 and 2017, the series "Artificial Intelligence in China in its direct sources" collects four independent volumes that bring together the AI news in that country. Volume 1: Specific Policies; Volume 2: Strategic Policies; Volume 3: Cooperation, Research and Events and, Volume 4: Market.The first volume begins with Innovation as the axis of development and the important role of science and technology. Below is an approximation to the topics of Internet and Big Data and Cloud Computing. It continues with the description of specific public policies and ends with the rescue of experiences of development in geographical areas.The second volume compiles the presence of AI in various strategic plans, including the 13th Five-Year Plan 2016-2020, Internet Plus Policy Strategy, Silk Road Economic Belt and the 21st Century Maritime Silk Road, Made in China 2025 and Healthy China 2030. The third volume recapitulates the importance given to research, major technological developments, events and a sample of international cooperation on this topic. The last volume gathers basic information about the market, its main companies and advances.One day the AI will stop being "artificial" to recover, in another sense, the term "natural". When this happens, China will be there.Walter Farah Calderón

Artificial Intelligence Saswat Sarangi 2018-09-03 What will the future be? A dystopian landscape controlled by machines or a brave new world full of possibilities? Perhaps the answer lies with Artificial Intelligence (AI)—a phenomenon much beyond technology that has, continues to, and will shape lives in ways we do not understand yet. This book traces the evolution of AI in contemporary history. It analyses how AI is primarily being driven by "capital" as the only "factor of production" and its consequences for the global political economy. It further explores the dystopian prospect of mass unemployment by AI and takes up the ethical aspects of AI and its possible use in undermining natural and fundamental rights. A tract for the times, this volume will be a major intervention in an area that is heavily debated but rarely understood. It will be essential reading for researchers and students of digital humanities, politics, economics, science and technology studies, physics, and computer science. It will also be key reading for policy makers, cyber experts and bureaucrats.

The Economics of Artificial Intelligence Ajay Agrawal 2019-05-22 Advances in artificial intelligence (AI) highlight the potential of this technology to affect productivity, growth, inequality, market power, innovation, and employment. This volume seeks to set the agenda for economic research on the impact of AI. It covers four broad themes: AI as a general purpose technology; the relationships between AI, growth, jobs, and inequality; regulatory responses to changes brought on by AI; and the effects of AI on the way economic research is conducted. It explores the economic influence of machine learning, the branch of computational statistics that has driven much of the recent excitement around AI, as well as the economic impact of robotics and automation and the potential economic consequences of a still-hypothetical artificial general intelligence. The volume provides frameworks for understanding the economic impact of AI and identifies a number of open research questions. While some 30 years ago the addition of a computer was considered only for routine and boring tasks in support of humans, the balance has dramatically shifted to the computer being able to perform almost any task the human is willing to delegate. The very fast pace of change in processor and information technology has been the main driving force behind this development. Advances in automation and especially Artificial Intelligence (AI) have enabled the formation of a rather unique team with human and electronic members. The team is still supervised by the human with the machine as a subordinate associate or assistant, sharing responsibility, authority and autonomy over many tasks. The requirement for teaming human and machine in a highly dynamic and unpredictable task environment has led to impressive achievements in many supporting technologies. These include methods for system analysis, design and engineering and in particular for information processing, for cognitive and complex knowledge [1] engineering .

Society 5.0 and Literacy 4.0 for the 21st Century METKA KORDIGEL. ABERS?EK 2020-04-04 Contemporary society, the society of the future, will require us to develop entirely new knowledge, skills and competences. In this respect, functional literacies are among the key competences for the 21st century society, which is known in Japan as Society 5.0, or the so-called super-smart society. The qualitative leap from Society 3.0, the industrial society, to Society 4.0, known also as the information society, has already been marked by computers and their processing power in the form of virtually unlimited memory capacity. Humans as intelligent beings, on the other hand, have made little progress over the last few centuries in terms of information processing power and storage capacity. The shift to a super-smart society, i.e., Society 5.0, can hardly be imagined with just humans as the central characters in these changes, given their limited processing power and memory capacity. The society of the future, the super-smart society, is surely going to be a technological society, a society of independent and smart systems, which are going to be managed and directed more or less by artificial intelligence (AI), because this is the only way to arrive to the so-called super-smart society. In such an environment it will be vital for humans, who will be increasingly dependent on technology, not only to be able to communicate with their equals, i.e., other humans, but also to be able to understand technology and AI, and communicate with it in some way or another. This book focuses on literacy for the 21st century and/or Society 5.0 in the narrow sense. In other words, the focus is on the reading, writing and communication processes as part of digital literacy, or, indeed, as part of the digital, technological and engineering literacy 4.0/5.0 paradigm. The latter includes competences required for the three main ways of communication in the 21st century, which are: áhuman-human communication via the Internet of Things (IoT) or/and the Internet of People (IoP), áhuman-machine communication, directly and via the IoT, ácommunication between humans and artificial intelligence (AI). In these three types of communication, humans will be expected to apply particular ways of thinking and reasoning when addressing a problem, and to acquire and demonstrate three kinds of practices/skills in particular: áunderstanding technological principles, ádeveloping solutions and achieving goals, and ácommunicating and collaborating. The main topics in this book are organized into nine core chapters, including the following: Development of Human Society and the Function of Communication Skills and Media, Historical Development of Communication Media, Literacy and Artificial Intelligence, and The Direction of Society's Development in the 21st Century. It seems fair to assume that some of the explanations, points of view and parts of content presented in this book will be different from notions generally true. We hope that because of this, we will be able to provoke cognitive dissonance/intellectual unease in the reader, thus encouraging them to update and/or internalize some of the "theories inside their heads", which have been embedded there since their school years.

T-Minus AI Michael Kanaan 2020-08-25 Late in 2017, the global significance of the conversation about artificial intelligence (AI) changed forever. China put the world on alert when it released a plan to dominate all aspects of AI across the planet. Only weeks later, Vladimir Putin raised a Russian red flag in response by declaring AI the future for all humankind, and proclaiming that, "Whoever becomes the leader in this sphere will become the ruler of the world." The race was on. Consistent with their unique national agendas, countries throughout the world began plotting their paths and hurrying their pace. Now, not long after, the race has become a sprint. Despite everything at stake, to most of us AI remains shrouded by a cloud of mystery and misunderstanding. Hidden behind complicated and technical jargon and confused by fantastical depictions of science fiction, the modern realities of AI and its profound implications are hard to decipher, but crucial to recognize. In T-Minus AI: Humanity's Countdown to Artificial Intelligence and the New Pursuit of Global Power, author Michael Kanaan explains AI from a human-oriented perspective we can all finally understand. A recognized national expert and the U.S. Air Force's first Chairperson for Artificial Intelligence, Kanaan weaves a compelling new view on our history of innovation and technology to masterfully explain what each of us should know about modern computing, AI, and machine learning. Kanaan also dives into the global implications of AI by illuminating the cultural and national vulnerabilities already exposed and the pressing issues now squarely on the table. AI has already become China's all-purpose tool to impose its authoritarian influence around the world. Russia, playing catch up, is weaponizing AI through its military systems and now infamous, aggressive efforts to disrupt democracy by whatever disinformation means possible. America and like-minded nations are awakening to these new realities—and the paths they're electing to follow echo loudly the political foundations and, in most cases, the moral imperatives upon which they were formed. As we march toward a future far different than ever imagined, T-Minus AI is fascinating and crucially well-timed. It leaves the fiction behind, paints the alarming implications of AI for what they actually are, and calls for unified action to protect fundamental human rights and dignities for all.

The BOXES Methodology Second Edition David W. Russell 2021-11-18 This book focuses on how the BOXES Methodology, which is based on the work of Donald Michie, is applied to ill-defined real-time control systems with minimal a priori knowledge of the system. The method is applied to a variety of systems including the familiar pole and cart. This second edition includes a new section that covers some further observations and thoughts, problems, and evolutionary extensions that the reader will find useful in their own implementation of the method. This second edition includes a new section on how to handle jittering about a system boundary which in turn causes replicated run times to become part of the learning mechanism. It also addresses the aging of data values using a forgetfulness factor that causes wrong values of merit to be calculated. Another question that is addressed is "Should a BOXES cell ever be considered fully trained and, if so, excluded from further dynamic updates". Finally, it expands on how system boundaries may be shifted using data from many runs using an evolutionary paradigm.

Reprogramming The American Dream Kevin Scott 2020-04-07 ** #1 Wall Street Journal Bestseller ** In this essential book written by a rural native and Silicon Valley veteran, Microsoft's Chief technology officer tackles one of the most critical issues facing society today: the future of artificial intelligence and how it can be realistically used to promote growth, even in a shifting employment landscape. There are two prevailing stories about AI: for heartland low- and middle-skill workers, a dystopian tale of steadily increasing job destruction; for urban knowledge workers and the professional class, a utopian tale of enhanced productivity and convenience. But there is a third way to look at this technology that will revolutionize the workplace and ultimately the world. Kevin Scott argues that AI has the potential to create abundance and opportunity for everyone and help solve some of our most vexing problems. As the chief technology officer at Microsoft, he is deeply involved in the development of AI applications, yet mindful of their potential impact on workers—knowledge he gained firsthand growing up in rural Virginia. Yes, the AI Revolution will radically disrupt economics and employment for everyone for generations to come. But what if leaders prioritized the programming of both future technology and public policy to work together to find solutions ahead of the coming AI epoch? Like public health, the space program, climate change and public education, we need international understanding and collaboration on the future of AI and work. For Scott, the crucial question facing all of us is this: How do we work to ensure that the continued development of AI allows us to keep the American Dream alive? In this thoughtful, informed guide, he offers a clear roadmap to find the answer.

Concepts for Army Use of Robotic-Artificial Intelligence in the 21st Century Dennis V. Crumley 1982 This report identifies potential military applications of robotic-artificial intelligence technology and considers near-, mid-, and far-term technological projections. Criteria for applications include their potential cost effectiveness, as already proven in civilian industry; the speed, accuracy and uniform quality of effort which robots can achieve; their ability to perform in hazardous environments; their role as soldier replacements or multipliers; and their ability to save lives on high risk missions. The author concludes that there are a great many feasible applications, but for the Army to realize the great potentials of this field by the turn of the century, research and development in all robotic related sciences must be better funded and better coordinated. The author makes the following recommendations: Training and Doctrine Command should verify the potential applications as soon as possible, arrange them in order of tactical importance, and relay those requirements to materiel developers. Department of Defense/or Department of Army should take the top two or three of the most important applications and have them pursued independently by agencies which are unencumbered by normal research and development bureaucracies. Managing A Nation Gerald O. Barney 2019-04-08 This book is a collection of reviews of microcomputer programs of special relevance to those people around the world who are responsible for the management of the current and future affairs and business of their countries.

Meta-Scientific Study of Artificial Intelligence Elena G. Popkova 2021-05-01 The book studies artificial intelligence as a new reality and a perspective direction for the modern economy's development, as well as its future technological basis. The book forms a meta-scientific approach to studying AI, which allows uniting the efforts of scholars from different spheres of science for formation of a comprehensive idea of AI. The book reflects the meta-scientific approach to the balanced use of human and artificial intelligence and the features of successful development of the information economy under the conditions of technological progress based on artificial intelligence. It describes the implementation of the subject approach in psychology and pedagogy based on artificial intelligence and reflects the political and legal aspects of creating, implementing and developing artificial intelligence. The impact of artificial intelligence on the economy and financial services is considered, and modernization of management of production and distribution processes and systems based on AI are studied. The target audience of the book includes scholars from different spheres of science who study AI, companies interested in implementation of AI, and government that regulates the issues of development and use of AI.

21st Century Robot Brian David Johnson 2014-11-18 When companies develop a new technology, do they ask how it might affect the people who will actually use it? That, more or less, sums up Brian David Johnson’s duties as Intel’s futurist-in-residence. In this fascinating book, Johnson provides a collection of science fiction prototyping stories that attempt to answer the question. These stories focus on the same theme: scientists and thinkers exploring personal robotics as a new form of artificial intelligence. This isn’t fanciful speculation. Johnson’s stories are based on Intel’s futurecasting research, which uses ethnographic field studies, technology research, trend data, and science fiction to develop a pragmatic vision of consumers and computing. 21st Century Robot presents science fiction designed to bring about science fact. Get real insight into technology and the future with this book. It will open your eyes.

The Myth of Artificial Intelligence Erik J. Larson 2021-04-06 Futurists are certain that humanlike AI is on the horizon, but in fact engineers have no idea how to program human reasoning. AI reasons from statistical correlations across data sets, while common sense is based heavily on conjecture. Erik Larson argues that hyping existing methods will only hold us back from developing truly humanlike AI.

The Reasonable Robot Ryan Abbott 2020-06-25 Argues that treating people and artificial intelligence differently under the law results in unexpected and harmful outcomes for social welfare.

Future Mind Jerome C. Glenn 1989 Glen examines the potential for future integration between man and machine drawing on examples in medicine (the Jarvik heart, Utah arm, Triad hip, etc) and advances in human-like processing via machine in terms of speech recognition and other information technologies. While the author touches on topics ranging from philosophy and religion to science and politics, the unifying theme is what he sees as the inescapable blending of machine-enhanced humans and ‘conscious’ artificial intelligence.

Intelligent Tutoring Systems for Foreign Language Learning Merryanna L. Swartz 2012-12-06 Multilingual communication within the world community is important for economic, political, and cultural interactions. In a global environment where other languages are increasing in importance in addition to recognized international standards (i. e., English and French), language learning is becoming more important for improved international relations. At the same time, recent advances in instructional technology make the promise of building intelligent tutoring systems in advanced technology laboratories to teach these language skills a reality in the near future. These tutoring systems, therefore, may help us foster improved methods for acquiring languages. As active language learners and instructional technology researchers, we felt an international meeting with similar individuals was needed to discuss how such advanced tutoring systems are to be designed and implemented. We held such a meeting, the results of which are presented in this volume. The purpose of this Advanced Workshop, sponsored by the NATO Scientific Affairs Division, was to bring together a multidisciplinary group of researchers who were active in the development of intelligent tutoring systems for foreign language learning. Participants came from computer science, computational linguistics, psychology, and foreign language learning. Washington, D.C. was selected for the Workshop site since it is Merryanna's home city, the capitol of the United States, and an international, multilingual community in its own right. Masoud agreed to the location (with a promise to be shown the White House!) and graciously volunteered to coordinate activities from the European side.

Challenges of Information Technology Management in the 21st Century Information Resources Management Association. International Conference 2000 As the 21st century begins, we are faced with opportunities and challenges of available technology as well as pressured to create strategic and tactical plans for future technology. Worldwide, IT professionals are sharing and trading concepts and ideas for effective IT management, and this co-operation is what leads to solid IT management practices. This volume is a collection of papers that present IT management perspectives from professionals around the world. The papers seek to offer new ideas, refine old ones, and pose interesting scenarios to help the reader develop company-sensitive management strategies.

Applications of Machine Learning and Artificial Intelligence in Education Khadimally, Seda 2022-02-18 Modes and models of learning and instruction have shown a significant shift from yesterday’s conventional learning and teaching given this era’s current educational and social contexts. Learners are no longer learning and communicating with human-generated, computed, and mediated—or traditional—learning and instructional practices, paving the way for machine-facilitated communication, learning, and teaching tools. Learning and instruction, communication and information exchange, as well as gathering, coding, analyzing, and synthesizing data have proven to be in need of even more innovative technology-moderated tools. Applications of Machine Learning and Artificial Intelligence in Education focuses on the parameters of remote learning, machine learning, deep learning, and artificial intelligence under 21st-century learning and instructional contexts. Covering topics such as data coding and social networking technology, it is ideal for learners with an interest in the deep learning discipline, educators, educational technologists, instructional designers, and data evaluators, as well as special interest groups (SGIs) in the discipline.

The Quest for Artificial Intelligence Nils J. Nilsson 2009-10-30 Artificial intelligence (AI) is a field within computer science that is attempting to build enhanced intelligence into computer systems. This book traces the history of the subject, from the early dreams of eighteenth-century (and earlier) pioneers to the more successful work of today's AI engineers. AI is becoming more and more a part of everyone's life. The technology is already embedded in face-recognizing cameras, speech-recognition software, Internet search engines, and health-care robots, among other applications. The book's many diagrams and easy-to-understand descriptions of AI programs will help the casual reader gain an understanding of how these and other AI systems actually work. Its thorough (but unobtrusive) end-of-chapter notes containing citations to important source materials will be of great use to AI scholars and researchers. This book promises to be the definitive history of a field that has captivated the imaginations of scientists, philosophers, and writers for centuries.

Handbook of Research on Artificial Intelligence in Government Practices and Processes Saura, Jose Ramon 2022-03-18 In today’s global culture where the internet has established itself as a main tool of communication, the global system of economy and regulations, as well as data and decisions based on data analysis, have become essential for public actors and institutions. Governments need to be updated and use the latest technologies to understand what society’s demands are, and user behavioral data, which can be pulled by intelligent applications, can offer tremendous insights into this. The Handbook of Research on Artificial Intelligence in Government Practices and Processes identifies definitional perspectives of behavioral data science and what its use by governments means for automation, predictability, and risks to privacy and free decision making in society. Many governments can train their algorithms to work with machine learning, leading to the capacity to interfere in the behavior of society and potentially achieve a change in societal behavior without society itself even being aware of it. As such, the use of artificial intelligence by governments has raised concerns about privacy and personal security issues. Covering topics such as digital democracy, data extraction techniques, and political communications, this book is an essential resource for data analysts, politicians, journalists, public figures, executives, researchers, data specialists, communication specialists, digital marketers, and academicians.

Humans Living with Artificial Intelligence in the 21st Century Phoenix De Vries, 1st 2021-10-24 "Humans Living With Artificial Intelligence in the 21st Century" is a thorough examination of how these two main forces must not only learn how to interact with one another, but remain compatible as well as functional. Central to the thought processes is the seemingly impossibility of humans and machines having sexual relations or AI developing real emotions. Would you swipe right for an AI? Phoenix De Vries has thrown down the gauntlet to remind all, that humans are created with the miracle of Divine Intelligence, as a developing Soul with connectivity to Spirituality and Universal Consciousness. As opposed to Artificial Intelligent machines which may be programmed to mimic feelings. Do you think AI without a Soul, will have the same depth as a human? Would you like your daughter marrying an AI? Are AIs going to be protectors or enslavers to our children?The very nature of AI decrees an unceasing changing

landscape where the intelligence actively grows to accomplish purpose. Some of the brightest minds of the 20th century have gone to great lengths to explore the potential of AI. Phoenix De Vries challenges this rapid increasing technological thinking and inspires us to trust the power of Cosmic Intelligence and our intimate connection to the Sublime Consciousness. Written with a balance of knowledge, lightheartedness and with great wit, "Humans Living With Artificial Intelligence in the 21st Century" takes that research to new levels that are guaranteed to leave you pondering the future.

The 21st Century Singularity and Global Futures Andrey V. Korotayev 2020-01-02 This book introduces a 'Big History' perspective to understand the acceleration of social, technological and economic trends towards a near-term singularity, marking a radical turning point in the evolution of our planet. It traces the emergence of accelerating innovation rates through global history and highlights major historical transformations throughout the evolution of life, humans, and civilization. The authors pursue an interdisciplinary approach, also drawing on concepts from physics and evolutionary biology, to offer potential models of the underlying mechanisms driving this acceleration, along with potential clues on how it might progress. The contributions gathered here are divided into five parts, the first of which studies historical mega-trends in relation to a variety of aspects including technology, population, energy, and information. The second part is dedicated to a variety of models that can help understand the potential mechanisms, and support extrapolation. In turn, the third part explores various potential future scenarios, along with the paths and decisions that are required. The fourth part presents philosophical perspectives on the potential deeper meaning and implications of the trend towards singularity, while the fifth and last part discusses the implications of the Search for Extraterrestrial Intelligence (SETI). Given its scope, the book will appeal to scholars from various disciplines interested in historical trends, technological change and evolutionary processes.

AI 2041 Kai-Fu Lee 2021-09-14 How will artificial intelligence change our world within twenty years? A WALL STREET JOURNAL, WASHINGTON POST, AND FINANCIAL TIMES BEST BOOK OF THE YEAR • “This inspired collaboration between a pioneering technologist and a visionary writer of science fiction offers bold and urgent insights.”—Yann LeCun, winner of the Turing Award; chief AI scientist, Facebook “Amazingly entertaining . . . Lee and Chen take us on an immersive trip through the future. . . . Eye-opening.”—Mark Cuban AI will be the defining development of the twenty-first century. Within two decades, aspects of daily human life will be unrecognizable. AI will generate unprecedented wealth, revolutionize medicine and education through human-machine symbiosis, and create brand-new forms of communication and entertainment. In liberating us from routine work, however, AI will also challenge the organizing principles of our economic and social order. Meanwhile, AI will bring new risks in the form of autonomous weapons and smart technology that inherits human bias. AI is at a tipping point, and people need to wake up—both to AI’s radiant pathways and its existential perils for life as we know it. In this provocative, utterly original work, Kai-Fu Lee, the former president of Google China and bestselling author of AI Superpowers, teams up with celebrated novelist Chen Qiufan to imagine our world in 2041 and how it will be shaped by AI. In ten gripping short stories, they introduce readers to an array of eye-opening 2041 settings, such as: • In San Francisco, the “job reallocation” industry emerges as deep learning AI causes widespread job displacement • In Tokyo, a music fan is swept up in an immersive form of celebrity worship based on virtual reality and mixed reality • In Mumbai, a teenage girl rebels when AI’s crunching of big data gets in the way of romance • In Seoul, virtual companions with perfected natural language processing (NLP) skills offer orphaned twins new ways to connect • In Munich, a rogue scientist draws on quantum computing, computer vision and other AI technologies in a revenge plot that imperils the world by gazing toward a not-so-distant horizon, AI 2041 offers urgent insights into our collective future—while reminding readers that, ultimately, humankind remains the author of its destiny.

Quantum Physics and Artificial Intelligence in the 21st Century Jan Krikke 2018-09-12 What happens when we look at two of the most important sciences of today, quantum physics and artificial intelligence, through Chinese eyes?We see that the Chinese developed an esthetic theory about space and time centuries before Albert Einstein developed Relativity Theory. We also understand why the Chinese world view inspired quantum mechanics pioneers Niels Bohr and Werner Heisenberg, psychoanalyst Carl Jung and the leading figures of the spiritually focused New Age movement.A fresh look at China's ancient world view can even help us understand why binary code inventor Gottfried Leibniz argued that the Chinese invented the first binary code. The Chinese used different symbols - broken and unbroken lines instead of 0 and 1 - but Leibniz claimed the underlying principle was the same. Leibniz is the "spiritual" father of AI and the first to propose the "mechanization" of thought.AI and quantum mechanics are confronted with similar questions: Is nature continuous or discrete, wave or particle, analog or digital? How will AI address this dichotomy? Can the Chinese world view shed light on this unresolved mystery?In the 21st century, China is likely to make its presence felt throughout the world. Understanding its ancient world view can help us anticipate this influence and it may show us the contours of the future of AI, arguably the last "hard" science humanity will ever need."This book contains fascinating stories largely unknown, a history of Western scientific ideas, an insightful interpretation of ancient Chinese culture, and mind-expanding connections between East and West, art and technology, past and future. A unique play of creative ideas!"Bill Kelly, Lecturer in Intercultural Communication, UCLA (ret.)

Artificial Intelligence Henry Alexander Wittke 2020-05-07 The ongoing and seemingly unstoppable digital transformation brings forth new options, opportunities but also challenges to individuals, organizations, companies and societies alike. Governments are alarmed, realizing the potential consequences on the workforce, while also being apparently helpless against uncontrollable and powerful digital players such as Google or Facebook. As Henry Wittke shows, recent breakthroughs in the field of machine learning increase the potential of Artificial Intelligence to disrupt the world's largest industries. Wittke attempts to provide a basic framework of what constitutes AI as well as to assess its impact on the Information Economy. What happens in case of rising mass unemployment or social inequality? What will be the effect on labor as a value system for today’s societies? Could the entire notion of capitalism be questioned in the wake of AI? The book aims to draw conclusions and give recommendations to policymakers.

Artificial Intelligence in Education Wayne Holmes 2019-02-28 "The landscape for education has been rapidly changing in the last years: demographic changes affecting the makeup of families, multiple school options available to children, wealth disparities, the global economy demanding new skills from workers, and continued breakthroughs in technology are some of the factors impacting education. Given these changes, how can schools continue to prepare students for the future? In a world where information is readily available online, how can schools continue to be relevant? The emergence of Artificial Intelligence (AI) has exacerbated the need to have these conversations. Its impact on education and the multiple possibilities that it offers are putting pressure on educational leaders to reformulate the school curriculum and the channels to deliver it. The book "Artificial Intelligence in Education, Promises and Implications for Teaching and Learning" by the Center for Curriculum Redesign immerses the reader in a discussion on what to teach students in the era of AI and examines how AI is already demanding much needed updates to the school curriculum, including modernizing its content, focusing on core concepts, and embedding interdisciplinary themes and competencies with the end goal of making learning more enjoyable and useful in students' lives. The second part of the book dives into the history of AI in education, its techniques and applications -including the way AI can help teachers be more effective, and finishes on a reflection about the social aspects of AI. This book is a must-read for educators and policy-makers who want to prepare schools to face the uncertainties of the future and keep them relevant." --Amada Torres, VP, Studies, Insights, and Research, National Association of Independent School (NAIS) "The rapid advances in technology in recent decades have already brought about substantial changes in education, opening up new opportunities to teach and learn anywhere anytime and providing new tools and methods to improve learning outcomes and support innovative teaching and learning.Research into artificial intelligence and machine learning in education goes back to the late 1970s. Artificial intelligence methods were generally employed in two ways: to design and facilitate interactive learning environments that would support learning by doing, and to design and implement tutoring systems by adapting instructions with respect to the students' knowledge state.But this is just the beginning. As Artificial Intelligence in Education shows, AI is increasingly used in education and learning contexts. The collision of three areas - data, computation and education - is set to have far-reaching consequences, raising fundamental questions about the nature of education: what is taught and how it is taught. Artificial Intelligence in Education is an important, if at times disturbing, contribution to the debate on AI and provides a detailed analysis on how it may affect the way teachers and students engage in education. The book describes how artificial intelligence may impact on curriculum design, on the individualisation of learning, and on assessment, offering some tantalising glimpses into the future (the end of exams, your very own lifelong learning companion) while not falling victim to tech-hype. The enormous ethical, technical and pedagogical challenges ahead are spelt out, and there is a real risk that the rapid advances in artificial intelligence products and services will outstrip education systems' capacity to understand, manage and integrate them appropriately. As the book concludes: "We can either leave it to others (the computer scientists, AI engineers and big tech companies) to decide how artificial intelligence in education unfolds, or we can engage in productive dialogue."I commend this book to anyone concerned with the future of education in a digital world." --Marc Durando, Executive Director, European Schoolnet
