Consulting Editor, Dr. Lucky Jain, Drs. Maximo Vento and Waldemar Carlo have put together a state-of-the-art issue of the Clinics in Perinatology devoted to Perinatal Pharmacology. Clinical review articles are specifically devoted to the following: Monitoring and assessment of oxygenation in infants; Oxygen

toxicity in neonates; New methods for non-invasive oxygen administration; Targeting oxygen in preterm and term infants starting at birth; Newborn resuscitation in settings without access to supplemental oxygen; Noninvasive versus invasive ventilatory support; Nasal SIMV versus Nasal CPAP before and after invasive ventilatory support; Is high-flow cannula inferior to CPAP for neonates?; Intermittent hypoxia: Importance; Closed-loop control of inspired oxygen in neonates: Compliance with targets; Meta-analysis oxygenation saturation targeting trials: Do infant subgroups matter?; Targets of oxygen saturation to optimize eye outcomes; Achieved oxygenation saturations and outcome in extremely preterm infants; Pulmonary hypertension in preterm

infants; and Current recommendations and practice of oxygen therapy in preterm infants. Readers will come away with the latest information on oxygen therapy as they seek to utilize evidence-based recommendations to improve patient outcomes.

Oxygen Therapy for Children World Health Organization 2017-03-14

"Hypoxaemia is a major contributor to child deaths that occur worldwide each year; for a child with pneumonia hypoxaemia increases the risk of death by up to 5 times. Despite its importance in virtually all types of acute severe illness, hypoxaemia is often not well recognized or well managed more so in settings where resources are limited. Oxygen therapy remains an inaccessible luxury for a large proportion of severely ill

children admitted to hospitals in developing countries. This is particularly true for patients in small district hospitals, where, even if some facility for delivering oxygen is available, supplies are often unreliable and the benefits of treatment may be diminished by poorly maintained, inappropriate equipment or poorly trained staff with inadequate guidelines. Increasing awareness of these problems is likely to have considerable clinical and public health benefits in the care of severely ill children. Health workers should be able to know the clinical signs that suggest the presence of hypoxaemia and have more reliable means of detection of hypoxaemia. This be achieved through more widespread use of pulse oximetry, which is a non-invasive measure of

arterial oxygen saturation. At the same time oxygen therapy must be more widely available; in many remote settings, this can be achieved by use of oxygen concentrators, which can run on regular or alternative sources of power. Having effective systems for the detection and management of hypoxaemia are vital in reducing mortality from pneumonia and other severe acute illnesses. Oxygen therapy is essential to counter hypoxaemia and many a times is the difference between life and death. This manual focuses on the availability and clinical use of oxygen therapy in children in health facilities by providing the practical aspects for health workers, biomedical engineers, and administrators. It addresses the need for appropriate detection of

hypoxaemia, use of pulse oximetry, clinical use of oxygen and delivery systems and monitoring of patients on oxygen therapy. In addition, the manual addresses practical use of pulse oximetry, and oxygen concentrators and cylinders in an effort to improve oxygen systems worldwide."--Publisher's description

Starr 1995 The Food and Drug Administration (FDA) controls the distribution and labeling of portable oxygen devices used for emergency resuscitation and life support. The Occupational Safety and Health Administration (OSHA), a division of the Department of Labor, promulgates standards for ensuring adequate safety and health at the workplace which include the use of devices during life support and first aid. Unfortunately, neither agency has established criteria or content for a medical oxygen training class.

oxygen to those that need it is an essential element of emergency care. Oxygen Administration is designed to provide an understanding of how to safely handle and administer oxygen in various settings. Key topics discussed in the Oxygen Administration course include: the components that make-up a supplemental oxygen system; the various types of supplemental oxygen devices; important safety, storage, service, and maintenance steps regarding the use of supplemental oxygen systems; the importance of supplemental oxygen in the care of victims of sudden illness or injury; and using supplemental oxygen equipment when providing care for a breathing or non-breathing victim. *Statement on Oxygen Administration with Reference to Retrolental*

*Basic Oxygen Administration* 2016 This program describes the basics of administering oxygen to patients. It describes the use of both high and low flow delivery devices such as

nasal cannula, simple masks, venturi masks and non-rebreather masks. Also describes nursing considerations, infection control measures and safety measures.
